

PHT Placement Guide

PHT is an acronym for “Phono Transducer” and is an evolution of our award winning UEF technology. Available in two different strains, Type ‘I’ PHT adds a holographic ethereal quality to your favorite music while Type ‘S’ is all about focus, clarity and musicality.

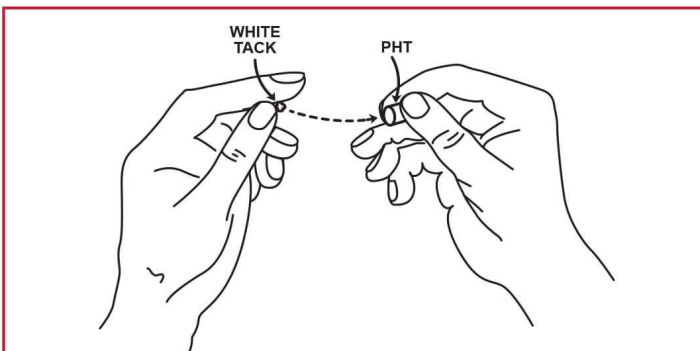

To get started simply apply 1 micro PHT transducer, Type ‘I’ or Type ‘S’, to the top of your phono cartridge or head-shell for an immediate and dramatic transformation. Improvements include a lower noise floor, increased resolution, improved bass extension with increased air and sound staging.

Future PHT Offerings:

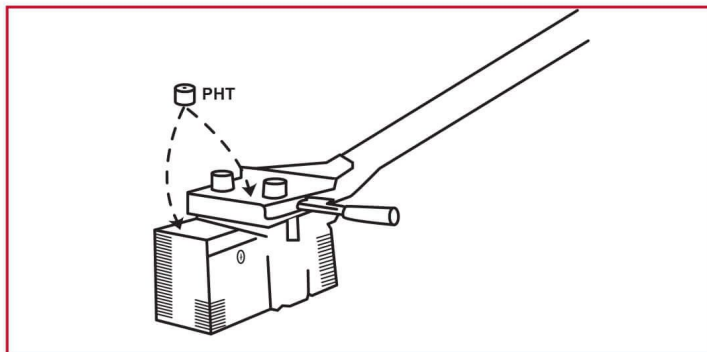

Every 90-days or so we will have a new crop of 2 new strains of precision hand made micro PHTs, one Type ‘I’ and one Type ‘S’ for you to try in your system for 30-days risk-free. Should you collect all 8-strains of PHT in the first year, you will receive a free presentation case to hold all your PHTs- plus one strain of PHT not available for sale. For a total of 9 PHTs in the year.

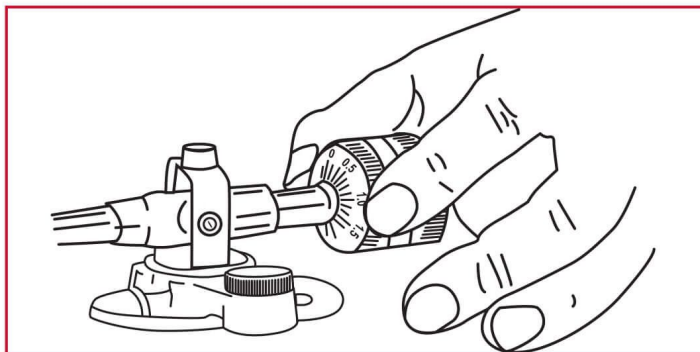

1. Check your cartridge's tracking force.

2. Apply a small amount of “White Tack” museum putty to the bottom of the PHT.

3. Firmly adhere PHT to either the TOP of the cartridge or the TOP of the headshell.

4. Re-adjust applicable settings.
